Addresses

**Historical view**

Emergency  
Measures

NAT

Prefixes  
delegation

Addresses

Protocol

Associated  
Protocols &  
Mechanisms

Strategy

Change  
Security

Next Steps ?

Conclusion

- 1983 : Research network for about 100 computers
- 1992 : Commercial activity
  - Exponential growth
- 1993 : Exhaustion of the class B address space
  - Allocation in the class C space
  - Require more information in routers memory
- Forecast of network collapse for 1998!
  - 1999 : Bob Metcalfe ate his Infoworld 1995 paper where he made this prediction

Facts on Addresses

Addresses

Protocol

Associated  
Protocols &  
Mechanisms

Strategy

Change  
Security

Next Steps ?

Conclusion

## RFC 1517 - RFC 1520 (Sept 1993)

- Ask the internet community to give back allocated prefixes (**RFC 1917**)
- Re-use class C address space
- CIDR (Classless Internet Domain Routing)
  - network address = prefix/prefix length
  - less address waste
  - recommend aggregation (reduce routing table length)
- Introduce private prefixes (**RFC 1918**)

Facts on Addresses

NAT

# Emergency Measures: Private Addresses (RFC 1918 BCP)

Facts on  
Addresses

Historical view

Emergency  
Measures

**NAT**

Prefixes  
delegation

Addresses

Protocol

Associated  
Protocols &  
Mechanisms

Strategy

Change  
Security

Next Steps ?

Conclusion

- Allow private addressing plans
- Addresses are used internally
- Similar to security architecture with firewalls
- Use of proxies or NAT to go outside
  - [RFC 1631](#), [RFC 2663](#) and [RFC 2993](#)
- NAPT is the most commonly used of NAT variations

# How NAT with Port Translation Works

delegation

Addresses

Protocol

Associated  
Protocols &  
Mechanisms

Strategy

Change  
Security

Next Steps ?

Conclusion

## first consequence

The application does not know its public name.

## second consequence

It is difficult to contact a NATed equipment from outside

- Security feeling
- Solutions for NAT traversal exist

## third consequence

There is no standardized behavior for NAT yet

Strategy

Change  
Security

Next Steps ?

Conclusion

- Larger address space from  $2^{32}$  to  $2^{128}$ 
  - Permanent address
- Stateless auto-configuration of hosts
  - Layer 3 "Plug & Play" Protocol
- Simple header  $\Rightarrow$  Efficient routing
  - No checksum
  - No fragmentation by routers
  - Enhanced extension system
- Better support of mobility

# Is it enough for the future ?

Facts on  
Addresses

Addresses

Notation  
Addressing  
scheme  
Kind of addresses

Protocol

Associated  
Protocols &  
Mechanisms

Strategy

Change  
Security

Next Steps ?

Conclusion

- Address length
  - About  $3.4 \times 10^{38}$  addresses
  - 60 000 trillion trillion addresses per inhabitant on earth
  - Addresses for every grain of sands in the world
  - IPv4: 6 addresses per US inhabitant, 1 in Europe, 0.01 in China and 0.001 in India
- Justification of a fixed-length address

## Warning:

- An address for everything **on the network** and not an address for everything
- No addresses for the whole life:
  - Depends on your position on the network
  - ISP Renumbering may be possible

Conclusion

- **RFC 4291** defines current IPv6 addresses
  - loopback (::1)
  - link local (fe80::/10)
  - global unicast (2000::/3)
  - multicast (ff00::/8)
- Use CIDR principles:
  - Prefix / prefix length notation
  - 2001:db8:face::/48
  - 2001:db8:face:bed:cafe:deca:dead:beef/64
- **Interfaces have several IPv6 addresses**
  - at least a link-local and a global unicast addresses

Conclusion

## Interface ID can be selected differently

- Derived from a Layer 2 ID (i.e. MAC address) :
  - for Link Local address
  - for Global Address : plug-and-play hosts
- Assigned manually :
  - to keep same address when Ethernet card or host is changed
  - to remember easily the address
    - 1, 2, 3, ...
    - last digit of the v4 address
    - the IPv4 address (for nostalgic system administrators)
    - ...

Conclusion

- Equivalent to the private addresses in IPv4
- But try to avoid same prefixes on two different sites:
  - avoid renumbering if two company merge
  - avoid ambiguities when VPN are used
- These prefixes are not routable on the Internet

Unique Local IPv6 Unicast Addresses:

<http://www.sixxs.net/tools/grh/ula/> to create your own ULA prefix.

## Generic Format:

- T (Transient) 0: well known address - 1: temporary address
- P (Prefix) 1 : assigned from a network prefix (T must be set to 1)
- R (Rendez Vous Point) 1: contains the RP address (P & T set to 1)
- Scope :
  - 1 - interface-local
  - 2 - link-local
  - 3 - reserved
  - 4 - admin-local
  - 5 - site-local
  - 8 - organisation-local
  - e - global
  - f - reserved

Conclusion

## Definition

- IPv6 header follows the same IPv4 principle:
  - fixed address size ... but 4 times larger
  - alignment on 64 bit words (instead of 32)
- Features not used in IPv4 are removed
- Minimum MTU 1280 Bytes
  - If L2 cannot carry 1280 Bytes, then add an adaptation layer such as AAL5 for ATM or 6LoWPAN ([RFC 4944](#)) for IEEE 802.15.4.

## Goal :

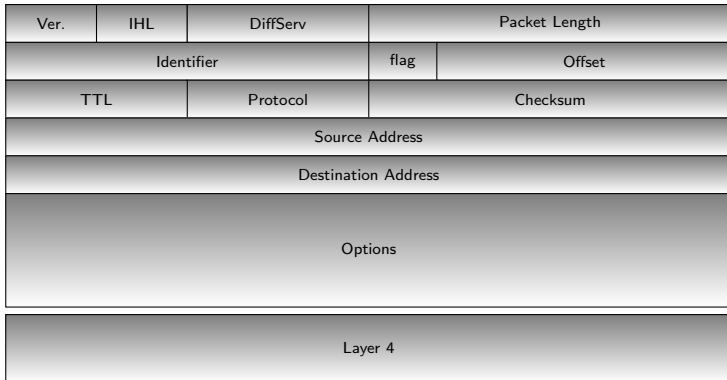

- Forward packet as fast as possible
- Less processing in routers
- More features at both ends

Next Steps ?

Conclusion

- IPv6 nodes sharing the same physical medium (link) use Neighbor Discovery (ND) to:
  - determine link-layer addresses of their neighbors
    - IPv4 : ARP
  - Address auto-configuration
    - Layer 3 parameters: IPv6 address, default route, MTU and Hop Limit
    - Only for hosts !
    - IPv4 : impossible, mandate a centralized DHCP server
  - Duplicate Address Detection (DAD)
    - IPv4 : gratuitous ARP
  - maintain neighbors reachability information (NUD)
- Mainly uses multicast addresses but also takes into account NBMA Networks (eg., ATM)
- Protocol packets are transported/encapsulated by/in ICMPv6 messages:
  - Router Solicitation: 133 ; Router Advertisement: 134 ; Neighbor Solicitation: 135 ; Neighbor Advertisement: 136 ; Redirect: 137

Next Steps ?

Conclusion

- For address or prefix allocation information form **only one** DHCPv6 must be taken into account. Four message exchange :
  - **Solicit** : send by clients to locate servers
  - **Advertise** : send by servers to indicate services available
  - **Request** : send by client to a specific server (could be through relays)
  - **Reply** : send by server with parameters requested
- Addresses or Prefixes are allocated for certain period of time
  - **Renew** : Send by the client tells the server to extend lifetime
  - **Rebind** : If no answer from renew, the client use rebind to extend lifetime of addresses and update other configuration parameters
  - **Reconfigure** : Server informs availability of new or update information. Clients can send renew or Information-request
  - **Release** : Send by the client tells the server the client does not need any longer addresses or prefixes.
  - **Decline** : to inform server that allocated addresses are already in use on the link

IPv6 Format  
Versus Addresses  
Devil is in details

Next Steps ?

Conclusion

- Charter:

L'établissement doit garder les traces nécessaires à l'identification d'un usager à partir de l'adresse IP utilisée en cas d'abus constaté :

accounting RADIUS, logs DHCP, NAT,...

Ces traces doivent comporter un horodatage fiable.

- No more NAT, No more DHCP
  - RADIUS will authorize users, but does not know the source IID
  - Works now but limit IPv6 flexibility.
  - Everything is in ...

## Two approaches:

- Try to mimic IPv4 behavior
  - Mandate DHCPv6 for addresses allocation
- Adapt to IPv6
  - Development of new tools and protocols around IPv6 for management.
- What to do with stateless auto-configuration?
  - It is not a **new** security problem
    - Any node can announce wrong prefixes
    - in IPv4, any node can be a DHCP Server
  - but lead to configuration problems.
    - How to block wrong prefix announcement ?
    - Use Cryptographic Certificats (SEND)?
    - Good in a very control environment
    - To complex and not enough flexible in company network.

IPv6 Format  
Versus Addresses  
Devil is in details

Next Steps ?

Conclusion

- In IPv4:
  - centralize management
  - DHCP server linked with a DNS
  - Is it really secure ?
- In IPv6:
  - Authentication at Layer 2 ?
    - IEEE 802.1X, WPA, PANA,...
  - Who has this address ?
    - A new group SAVI allows switches to log IPv6 addresses associated to switch port.
    - IEEE 802.1 ⇒ identity/port & PANA ⇒ address/port
  - Filter RA on switch port not connected to routers

IPv6 Format  
Versus Addresses  
Devil is in details

Next Steps ?

Conclusion

- In IPv4
  - DHCP server register host name and address in the DNS
  - direct and reverse
- In IPv6
  - The host cannot register easily in the DNS
    - Common key is incompatible with auto-configuration
- Do we need to register a IPv6 client in the DNS ?
  - Some applications require it
  - Is it really the good principle ? (security, confidentiality)

Next Steps ?

Change application architecture

Next Steps ?

Change  
application  
architecture

What is an  
address ?

Conclusion

- Applications are based on Client/Server paradigm.
  - Due to NAT, servers must be located in the core network.
- With IPv6, servers can be located anywhere
  - keep data locally
  - manage identity/authentication
  - make links between data
- Better control of the information
- Need for better throughput for uplinks
  - Optical fiber ?

Next Steps ?

Change  
application  
architecture

What is an  
address ?

Conclusion

- Address is no more a host property, but is linked to applications
  - Use rights as for file system
- Step to separate localization and identification.
  - Prefix part used for mobility or multi-homing
  - IID: used by applications
- Identification will not be unique:
  - trade-off between Authenticated (not unique) and Anonymous.
    - Authenticated with the bank.
    - Authenticated with the IRS.
    - Authenticated with a VoIP provider.
    - Anonymous on the web.

Next Steps ?

Conclusion

- 1 IPv6 is coming
  - There is no other alternative
- 2 Program applications using IPv6 compatible API
  - If addresses are sent in payload, take care of IPv6
- 3 Think differently:
  - Servers are not always far-away
- 4 Internet v4 evolution was blocked by the address space
  - Everything become possible with IPv6
